GERANIUM Pelargonium zonale 'FIP 469'

17A) Origin and breeding history of the variety

'Fip 469' was derived from a hybridization in 1997 and was selected as one seedling within the offspring in 1998.

The female parent was the variety 'Highfield's Festival', which was characterized by pink semi-double flowers, large, medium green leaves with weak zonation, and medium to tall plant habit.

The male parent was the hybrid seedling K96-1059-1, which was derived from crosses of 'Violetta', 'Fisdino' and a tetraploid line of 'Kardinal'. The seedling was characterized by pink single-type flowers with reddish eyes, dark-green foliage, no zonation, and about medium sized plant habit.

The hybridization and first selection of the seedlings was conducted at Moncarapacho, Portugal. Cuttings from the selected seedling were taken to HILLScheid for further selection and trial cultivation in 1999.

17 B and E) Statement of uniformity and stability Methods for maintaining the variety

Variety 'Fip 469' originated from a single seedling that was propagated asexually. It is a uniform clone, without genetical variation.

The stock plants in HILLScheid, Germany, and Cuernavaca, Mexico, had been obtained by tissue culture and were checked for health and stability of the described characteristics. They are being used for propagation by cuttings (usually stem terminal cuttings).

17 C) Distinctness statement

The most similar variety is the variety 'Fisfany', application on. 96-792, grant no. 352.

In comparison to 'Fisfany', flower color 'Fip 469' is a somewhat less deep shade of bluish pink, and plant habit of 'Fip 469' is distinctly taller.
